```
Isolated hucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                     The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                               Claim 20; SEQ ID NO 23409; 1399pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   98DE-01011194

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                       concoding a Propionibacterium acnes protein. The invention also relates to an isolated purplication. The invention also relates to polypeptides encoded by the polymuclectides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a diditionally encompasses expression vectors and host cells comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymeticotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a proteins. T cell populations or antigen-presenting cells that express the polypeptides antibodies, fusion proteins, T cell populations or antigen-presenting acne polypeptides antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for performing a diagnostic assay. The present and the kit is useful for performing a diagnostic assay. The present contain an immunogenic region. Note The sequence data for this patent did not form part of the printed specification, but was contain an immunoffice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory, cancer, leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                         to an isolated polymucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  agents.
```

prostatic cancer and (b) for therapy of prostate cancer, optionally where expressed by gene therapy methods. (a) is also used to isolate full-length genes (for gene therapy) and for recombinant production of (I), which can be used to raise specific antibodies. (A) are identified by assembly of ESTs (expressed sequence tags) before these are analyzed for expression pattern (tissue specificity). This approach eliminates many of the false results, as regards tissue specificity, associated with known methods that use single (usually short) ESTs. AAY48304-Y48456 represent peptides encoded by the expressed sequence tags described in the method of the invention

(CURA-) CURAGEN CORP.

Leach MD, Shimkets RA;

WPI; 2002-106200/14. N-PSDB; ABN75073. Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation.

Claim 10; Page 280; 2508pp; English.

Sequences ABB31028-ABB35561 represent 4534 novel human proteins designated ORF (open reading frame) 1-4534, and sequences ABN75054-ABN7567 represent cDNAs encoding them. The invention also encompasses 

cc polypeptides at least 80% identical to the ORFI-ORF4534 (collectively cf. referred to as ORFX) proteins, polymucleotides at least 85% identical to the ORFX undered cond sequences, vectors and host cells comprising ORFX polymucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX proteins, antibodies and polymucleotides methods of screening for modulators of ORFX expression or activity, and methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide crange of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, hadematopolesis regulation, cell differentiation, immune modulation, hadematopolesis regulation, cell differentiation, antiinflammatory activity, thrombolytic activity, named antiinflammatory activity, thrombolytic activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, or the proliferative disorders such as sporiasis and banigh tumours, cother proliferative disorders such as sporiasis and banigh tumours, cother proliferative disorders such as sporiasis and banigh tumours, corpus proliferative disorders such as sporiasis and banigh tumours, corpus proliferative disorders such as epollapsy and Alzheimer's disease, corpus and infectious diseases caused by viral, bacterial, diseases such as epollapsy and Alzheimer's disease, and infectious diseases caused by viral, bacterial, corpus disease, and infectious diseases caused by viral, bacterial, sequences, in penetic diagnosis, and in forensic belongs control of primers and probes, in the detection of ORFX general and in drug screening. The ORFX proteins may be useful for studying the function and/or activity of ORFX protein, and in drug specialic and in free profession and in drug specialic and special and in drug specialic and conditions, treatment and monitoring of ORFX resociated belonged to disages. ö Query Match Best Local Similarity 100... --- FUNCTION: This protein is one of the 16S ribosomal RNA binding proteins (By similarity).
--- SIMILARITY: Belongs to the S15P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-NOV-1995 (Rel. 32, Last sequence update)
28-REB-2003 (Rel. 41, Last annotation update)
308 ribosomal protein S15.
(RPSO-A OR RPSIS-A OR HI1328) AND (RPSO-B OR RPSIS-B OR HI1468)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacteria, Proteobacteria, Gammaproteobacteria, Pasteurellales,

The complete genome of hyperthermophile Methanopyrus kandleri AV19
and monophyly of archaedl methanogens."; Proc. Natl. Acad. Sci. U.S.A. 99:4644-4649 (2002).
I chomosome, suggesting a role in chromatin architecture. However, it does not significantly compact DNA (By similarity).
I chose not significantly compact DNA (By similarity).
I sumilarity themotetramer (By similarity) thereby repressing transcription. Regulation of DNA-based activities is therefore achieved at the chromatin level (By similarity).
C.I. SIMILARITY: Belongs to the archaeal histone-like Alba family.
                                                                                                                                    No.0CT-2003 (Rel. 42, Created)

"Sequential IH, 13C, and 15N NMR assignments and solution

conformation of apokedarcidin.";

Biochemistry 33:11438-11452(1954).

-!- FUNCTION: BINDS NON-COVALENTLY TO AN ENEDIYNE CHROMOPHORE WHICH IS

THE CYTOTOXIC AND MUTAGENIC COMPONENT OF THE ANTIBIOTIC. THE

CHROMOPHORE CLEAVES DUPLEX DNA SITE-SPECIFICALLY IN A SINGLE-

STRANDED MANNER. THE APOPROTEIN CLEAVES PROTEINS SELECTIVELY, IN

PARTICULAR HIGHLY BASIC HISTONES, WITH HI PROTEINS BEING CLEAVED

-!- DOWAIN: THIS PROTEIN CONSISTS OF AN IMMUNGGLOBULIN-LIKE SEVEN-

STRANDED ANTIPRAALLEL BERA-BARREL DOMAIN LINKED TO A SUBDOMAIN

-!- SIMILARITY: Belongs to the neocarzinostatin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Verasper moseri (Barfin flounder).

Andoh T., Nagasawa H.;
"Two molecular forms of insulin from barfin flounder, Verasper moseri, are derived from a single gene.";
acod. 15:931-937(1598)
-!- FUNCTION: Insulin decreases blood glucose concentration. It increases cell permeability to monosaccharides, amino acids and fatty acids. It accelerates glycolysis, the pentose phosphate cycle, and glycogen synthesis in liver.
-!- SUBCINIT: Heterodimer of a B chain and an A chain linked by two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SPECIES=L.americanus;

                                                       Hoppe-Seyler's Z. Physiol. Chem. 350:1286-1288(1969).

-!- FUNCTION: Insulin decreases blood glucose concentration. It increases cell permeability to monosaccharides, amino acids and fatty acids. It accelerates glycolysis, the pentose phosphate cycle, and glycogen synthesis in liver.

-!- SUBUNIT: Heterodimer of a B chain and an A chain linked by two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Adams M.D., Celniker S.E., Hölt R.A., Evans C.A., Gocayne J.D., Amanatides P.G., Scherer S.E., Li P.W., Hoskins R.A., Galle R.F., George R.A., Lewis S.E., Richards S., Ashburner M., Henderson S.N., Sutton G.G., Mortman J.R., Yandell M.D., Zhang Q., Chen L.X., Brandon R.C., Rogers Y.-H.C., Blazej R.G., Champe M., Pfelifer B.D.

                                                                                                                                                                                                                                                                   Canty J.M., Young R.F., Fallavollita J.A.;
Submitted (MAR-1998) to the EMBL/GenBank/DDBJ databases.
Submitted (MAR-1998) to the EMBL/GenBank/DDBJ databases.
-!-TMYCTION: Facilitative glucose transporter. This isoform likely mediates the bidirectional transfer of glucose across the plasma membrane of hepatocytes and is responsible for uptake of glucose by the beta cells; may comprise part of the glucose-sensing mechanism of the beta cells, may comprise part of the glucose-sensing mechanism of the beta cell. May also participate with the Na(+)/glucose corransporter in the transcellular transport of glucose in the small intestine and kidney (By similarity).
-!- SUMCELULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to the sugar transporter family. Glucose transporter subfamily.
28-FEB-2003 (Rel. 41, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
28-Oute carrier family 2, facilitated glucose transporter, member 2 (Glucose transporter type 2, liver) (Fragment).
51C2A2 OR GLUT2.
                                                                                                                                     Sus scrofa (Pig).

"I EUNCTION: Decarboxylation of S-adenosylmethionine provides the

multopropyl modety required for spermidine biosynthesis from

putressine (By similarity).

"I CATALYTIC ACTIVITY: S-adenosyl-L-methionine alt + CO(2).

adenosyl (3-aminopropyl) methylsulfonium salt + CO(2).

-I - CORACTOR: Pyruvoyl group (By similarity).

-I - SIMILARITY: Belongs to the prokaryotic AdometDC family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CHAIN (BY SIMILARITY).

- Tabley Lenino-2.4 (1H,3H) - Pyrimidinedione and L-3.4-dibydrohy-2
catalyzing the formation of riboflavin from 5-amino-6-(1'-D)
catalyzes the condensation of 5.7-dimethyl = lumazine. The beta subunit

catalyzes the condensation of 5.4-dihydrohy-2-butanone-4
phosphate yielding 6.7-dimethyl-8-lumazine. Ho beta subunit

catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-amino
2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4
phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).

catalyzes the condensation of 5-amino-2,6-dihydroxypyrimidine.

catalyzes the formatic for the DML synthese family.

cipharmax: Babolavin biosynthesis; last step.

condensation the DML synthese family.

condensation and the EMBL outstation the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its conservant in settlement is not removed. Usage by and for commercial conficied and this statement is not removed. Usage by and for commercial conficied and this statement is not removed. catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-amino-2,4(14,3H-)-yrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).
-!- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine = riboflawin + 4-(1-D-ribityl)amino-2,6-dihydroxypyrimidine.
-!- PATHWAY: Riboflavin blosynthesis; last step.
-!- SIMILARITY: Belongs to the DWRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      STRAIN=AFCC 43049;

C. Natl. Acad. Sci. U.S.A. 99:984-989(2002).

C. Natl. Suboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      similarity).

CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine = riboflavin + 4-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.

PATHWAY: Riboflavin blosynthesis; last step.

SIMILARITY: Belongs to the DMRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

-I- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzate the formation of riboflavin from 5-amino-6-(1'-D)-
ribityl-amino-2.4 (1H.3H)-pyrimidinhedione and L-3.4 d-dipydrohy.2-
butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-
amino-2,4 (HH.3H)-pyrimidinedione with L-3,4-dihydrohy.2-
butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By
                                                                                                                                                                                                                                                                                                                                                                                                   -!- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine = riboflavin + 4-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.ribATHWAY: Riboflavin biosynthesis; last step. -!- PATHWAY: Riboflavin biosynthesis; last step. -!- SIMILARITY: Belongs to the DWRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDIINE-88115138; PubMed-2828309; Deich R.A., Metcalf B.J., Finn C.W., Farley J.E., Green B.A.; Deich R.A., Metcalf B.J., Finn C.W., Farley J.E., Green B.A.; Cloning of genes encoding a 15,000-dalton peptidoglycan-associated outer membrane lipoprotein and an antigenically related 15,000-dalton J.
